

AI Work Portal Quick Guide

Condensed guide | NAS intake, meeting transcription, RAG search, and LINE collaboration

Before you begin

Open <https://59.120.2.102/> in a browser and sign in. Standard users see their own assets; administrators also access Model Management, LINE Enterprise Management, and Account Management.

Main navigation

Menu	Purpose
Dashboard	View asset counts, processing states, and NAS service information.
Meeting Records	Record meetings or upload audio; select ASR and translation models.
NAS Upload	Upload audio, video, images, PDF, DOCX, or general files.
Model Management	Inspect, add, download, cancel, retry, and refresh local models.
Database Search	Search meetings and assets by title, filename, or transcript.
AI Work	Choose local/cloud models and use cache or force a new call.

Three common workflows

1. Record a meeting

Enter a title → choose local/cloud ASR → choose translation → start/stop. NAS preserves source voice before transcription, translation, and indexing.

2. Upload and index

Open NAS Upload → choose a file and relevant model → upload. Wait for processing to complete, then query from the asset page.

3. Ask with AI Work

Choose execution location and model → enter a question → send. NAS cache is checked first; use Force Send to bypass it. Analysis results are saved automatically.

Sources and citations

RAG answers show filename, page, chunk type, and available image previews for source verification.

LINE, administration, and troubleshooting

LINE enterprise groups

In LINE Enterprise Management, an administrator syncs and approves groups, selects a company model, enables PDF summaries and @Claire RAG, and sets monthly call/token quotas. Direct messages cannot use company resources.

@Claire /id

Return groupId, group name, and userId.

@Claire What are the main conclusions of this document?

Ask naturally about PDFs and meeting data available to the group.

PDF: Upload directly as a LINE file

NAS storage, OCR/text extraction, embedding, RAG indexing, and summary push.

Administrator quick reference

Area	Action
Models	Inspect installation, capacity, and runtime; add/download/cancel/retry/refresh.
Accounts	Create users, assign roles, disable access, reset passwords, or remove unused accounts.
LINE	Approve groups, select company models, set feature switches and monthly quotas.
Audit	Review success, failure, cache hit, caller, model, input/output, and tokens.

Common issues

Issue	Resolution
Microphone unavailable	Public recording requires HTTPS; allow microphone access in the browser.
Model required	Install complete weights/runtime in Model Management or select an available cloud model.
No image/PDF text	Confirm PaddleOCR is installed; text PDFs are extracted directly.
Old answer reused	Exact or semantic cache matched; use Force Send to make a new call.
LINE repeats messages	Set PARROT_N=0 in /etc/linebot.env and restart linebot.service.

Operating principles

Preserve source files before model processing; check NAS cache and RAG before invoking an LLM; retain an audit record for every success and failure.
